Dear Tom:

Enclosed please find seven copies of our report entitled "Soil Moisture Ground Truth--Lafayette, Indiana, Site; St. Charles, Missouri, Site; Centralia, Missouri, Site" under the above contract. This work covers the most recent portion of our work under this contract.

Yours very truly,

M. W. BITTINGER & ASSOCIATES, INC.

## 1. INTRODUCTION

This report contains the soil moisture ground-truth measurements and ground-cover descriptions taken at three soil moisture survey sites located near Lafayette, Indiana; St. Charles, Missouri; and Centralia, Missouri. The data were taken on November 10, 1975, in connection with airborne remote sensing missions being flown by the Environmental Research Institute of Michigan under the auspices of the National Aeronautics and Space Administration.

## 2. SOIL MOISTURE SURVEY SITES

Three sites were selected for use in studying the remote sensing of soil moisture. The three sites were located near Lafayette, Indiana; St. Charles, Missouri; and Centralia, Missouri. The general locations of these sites are shown in Figure 1. The specific locations of the sites are shown in Figures 2 through 4. Each site was selected in an area that was relatively flat and contained a reasonable amount of bare ground. All sites were laid out so that they encompassed 15 square miles (3 miles north to south and 5 miles east to west). On each site corner reflectors were installed. These aluminum target locations are shown in Plate 1 through 3. These were picked up at Ann Arbor, Michigan (ERIM), set, picked up after the flight and returned to ERIM at Ann Arbor by Bittinger personnel.

## 3. SAMPLING AND ANALYSIS PROCEDURES

Emphasis was placed on the soil moisture in bare fields. At that time of year many of the fields had been rough plowed, and some had progressed to the point where wheat had been planted. Soil moisture was sampled in the top 0 to 1" and 0 to 6" by means of a soil sampling push tube. These samples were then placed in plastic bags and awaited gravimetric analysis.

REPRODUCIBILITY OF THE  
ORIGINAL PAGE IS POOR

The initial weighing of the soil samples was completed within approximately 36 hours after the initial sample was taken.

#### 4. SAMPLING POINTS

The sampling points were selected in the field at the time of the sampling since it was difficult to anticipate which fields would be bare and which would have either the previous year's crop still standing or would already be green with the new wheat crop. Every effort was made by the sampling teams to collect representative samples as well as those in areas where there were apparent soil moisture changes.

Difficulties with land access were encountered at the Centralia, Missouri, site, and therefore intensive sampling was done on only 1.0 square mile which was under agreement for research purposes by the Agricultural Research Service, USDA. No such problems were encountered at the other sites.

Specific sample points are shown on Plates 1 through 3.

#### 5. GROUND COVER

In addition to obtaining gravimetric soil moisture samples, the field crews noted insofar as possible the actual ground cover on the day of the flight. This was often difficult to ascertain due to the limited access. The information on Plates 4 through 6 represents a "best estimate" and should not be used in any other manner.

#### 6. DATA

Tables 1 through 3 contain the data collected at each site and are keyed to the sample points on Plates 1 through 3. Soil moisture analyses by Empire Laboratories are appended as Appendix A.

Gentlemen:

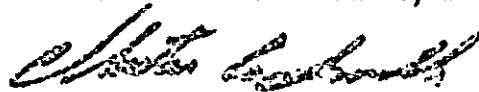

Re: Soil Samples - St. Charles, Missouri; Centralia, Missouri; and  
Lafayette, Indiana

Please find enclosed moisture contents from soil samples  
delivered to our laboratory on November 11, 1975, from the  
above-referenced projects.

If you have any questions regarding these moisture contents  
or if we can be of additional help to you on this project, please  
feel free to contact us.

Very truly yours,

EMPIRE LABORATORIES, INC.

Chester C. Smith, P. E.  
Vice President
